

TARO-EAD prep tool documentation

In-progress and with rolling updates

Purpose of the tool

The EAD prep tool is used to take the native export of ArchivesSpace ead and make tweaks and changes to raw xml so that it will render as desired in Texas Archival Resources Online (TARO) at <https://txarchives.org/home>, as well as to generate basic html version of the finding aid to help spot-check for issues hard to see in raw xml.

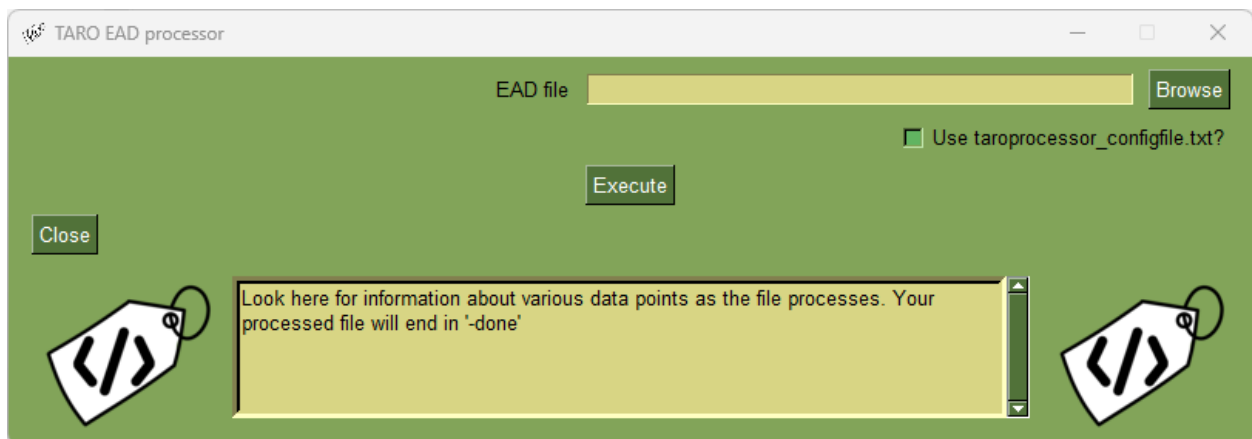

Location of tool and starting it up

The tool is located within the TARO-EAD-prep folder on the ARIS drive. Currently that is at F:\Archives\Collections_management\Finding_aids\TARO-EAD-prep.

Double-click on the exe file. It is likely the only exe file in the folder and should be named taro_processor_gui.exe. If there is more than one exe file in the folder, use the most recently created one.

The tool will take a while to start but should pop open a window like this:

With a toolbar icon of a tag in case you need to click away and came back. This is the same as the initial icons on either side of the message box.

Running the tool

taroprocessor_configfile.txt

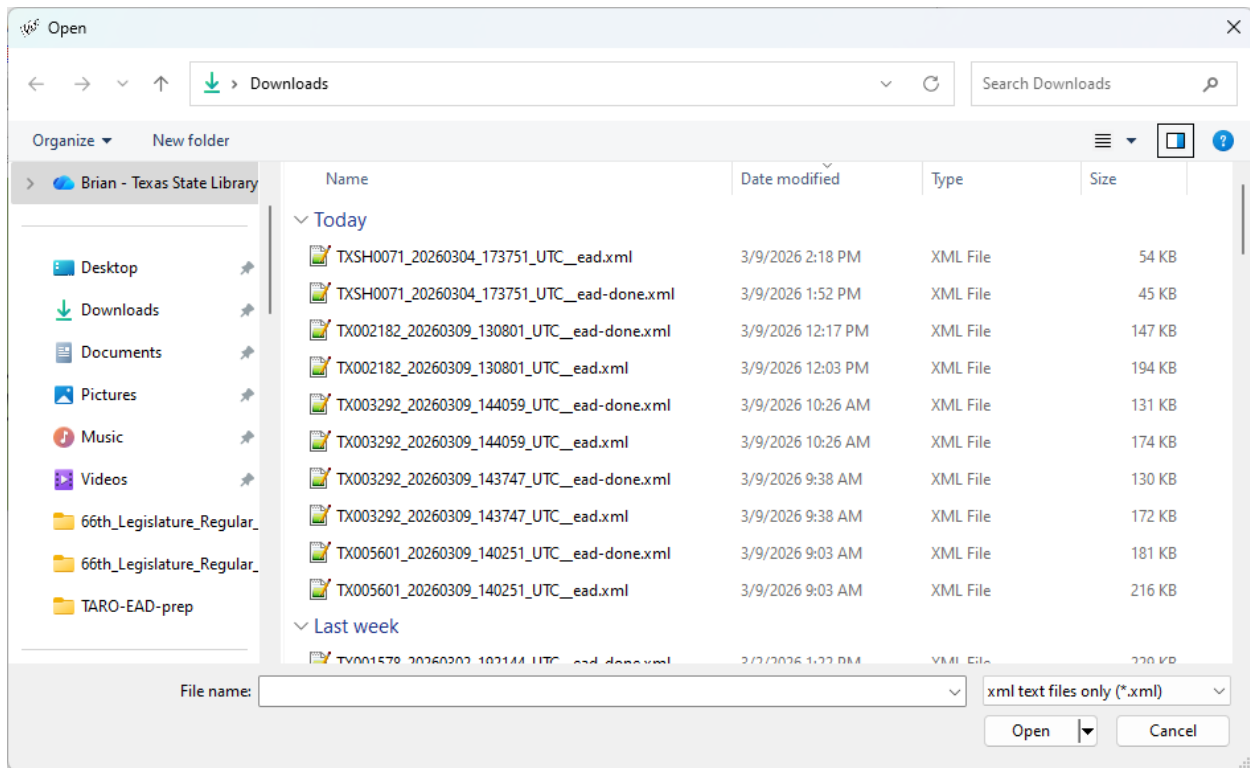

The “Use taroprocessor_configfile.txt?” checkbox is a file that lists what each extent should be if the extent type needs to be singularized. ArchivesSpace is set up to give extent type as a plural. The tool itself has built-in translations for the most common extent types. If you check this box, the content of the config file will completely override the built-in values, so if you delete a bunch of translation lines that are applicable it will not singularize those values. It can also be used to translate oddball extent types where the system has no embedded version and we have not yet asked them to update with the best translation. The following rules apply if you check the box

1. The file ***must*** be in the same folder as the tool
2. The name of the file must match exactly
3. All text must be aligned left
4. The section of the config files must be in brackets, these are
 - a. [extent_singular]
 - b. [extent_translations]
5. Each value to be fixed must have the wrong value on the left, a “ = “ and then the correct value to the right. Like seen below. Spaces around the equals sign are important

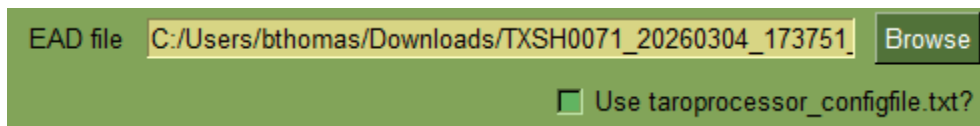

```
color prints = color print
indexes = index
```

Browse

Select the correct file using the Browse button. It should open a dialog box like show below. Navigate to the correct file, highlight it, and click on open (double-clicking the file should also work).

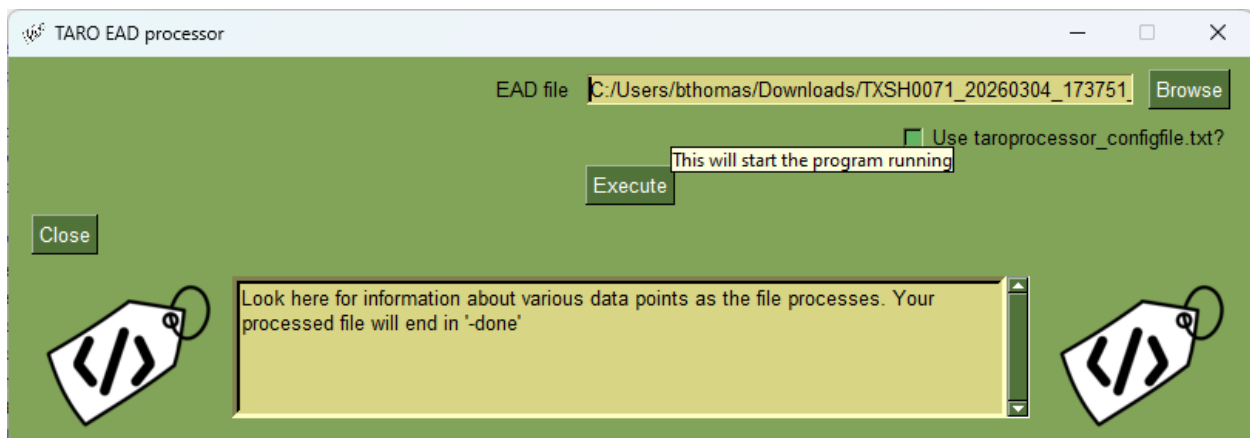

The filename should populate the EAD file line.

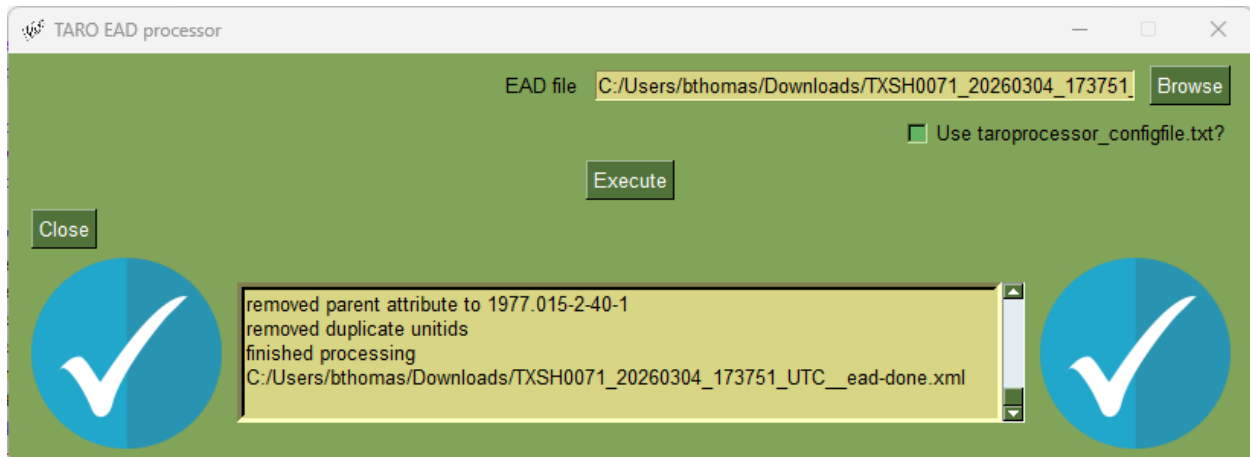

Alternatively you may manually input the filename in the EAD file line. Bear in mind that the system uses a Unix-based filepath rather than windows (“/” instead of “\”).

Execute

Click on execute to start the program. You may need to click on the button multiple times.

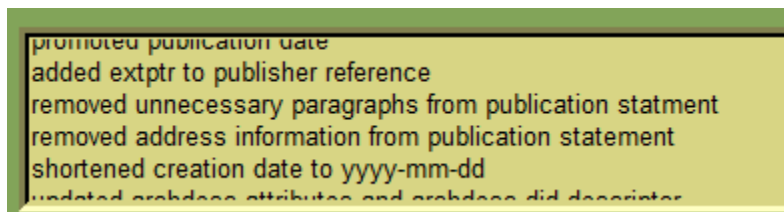

If the tool is successful in running against the file the tags on either side of the dialog box will turn to blue checkmarks.

Have an error?

See next section about what to do if you get an error message pop-up.

Check the dialog box

The tool I written to output messages about what it is doing to the file in a semi-granular way. Once the file successfully passes through, scroll through the dialog box message to see if anything looks not quite right and requires checking.

The output

The tool will update the original file to make the xml structure more readable and generate two output files

 TXSH0071_20260304_173751_UTC__ead.xml	3/9/2026 2:47 PM
 TXSH0071_20260304_173751_UTC__ead-done.html	3/9/2026 2:47 PM
 TXSH0071_20260304_173751_UTC__ead-done.xml	3/9/2026 2:47 PM

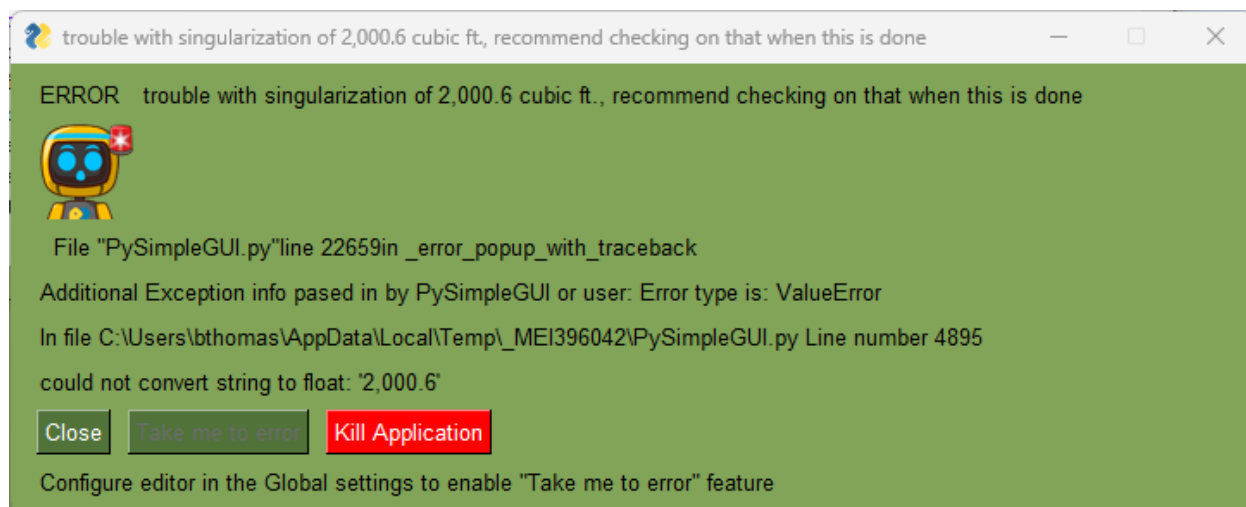

The file ending in -done.xml is the fully processed XML file.

The file ending in -done.html is a html version of the fully processed xml. Generated using the in-house stylesheet for html finding aids.¹ See the html output bookmark for an example of what that looks like.

It is *highly recommended* that you check the output via the html file at minimum to see if something in the data didn't get processed correctly. That is why it is there. it is also recommended to look at the raw EAD file to spot-check for errors which may not affect rendering but are there nevertheless.

What to do if you have a problem

Error messages like the following may show up if there is a problem:

Note that you may be able to click on “Close” and have the tool proceed depending on how that error is accounted for. It is recommended that you press “Kill Application” unless the error message box says to do otherwise.

Troubleshoot the issue

It is possible that the error is related to a problem with the xml rather than the tool. Try to rule that out. The custom-built error message should show up in a pop-up box. If it does not and the tool just closes, then it is an unanticipated error.

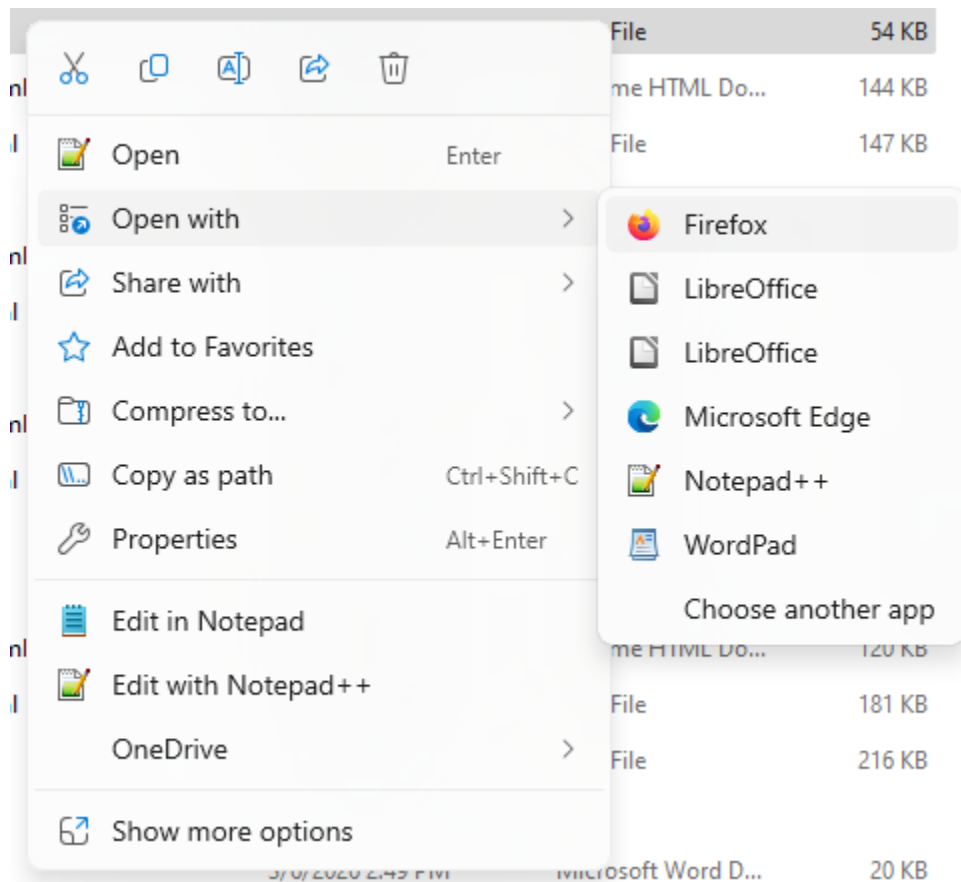

¹ The html output has minor differences in how it looks between when it is generated using this tool vs. oxygen xml editor. It is just a matter of small differences in how the data gets handled and does not actually change anything in the xml . Both outputs are technically correct to the transform to html stylesheet.

First, check for valid XML

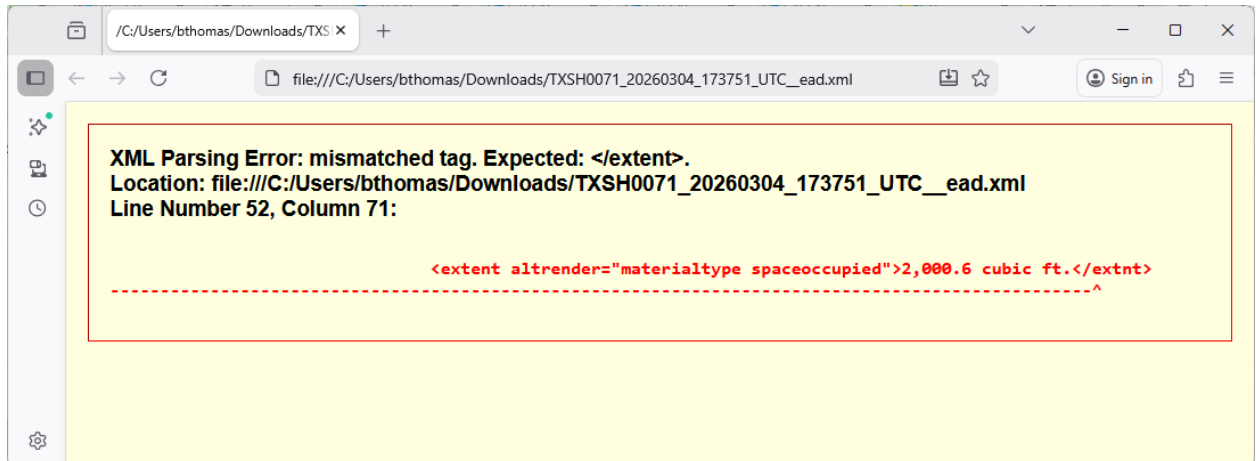

ArchivesSpace will export EAD xml based on the information it has. It will not check for XML errors in places where users have done input. A significant portion of errors come from mismatched, unclosed, or in some other way faulty tagging. So check the XML first.

1: Open the file in Firefox

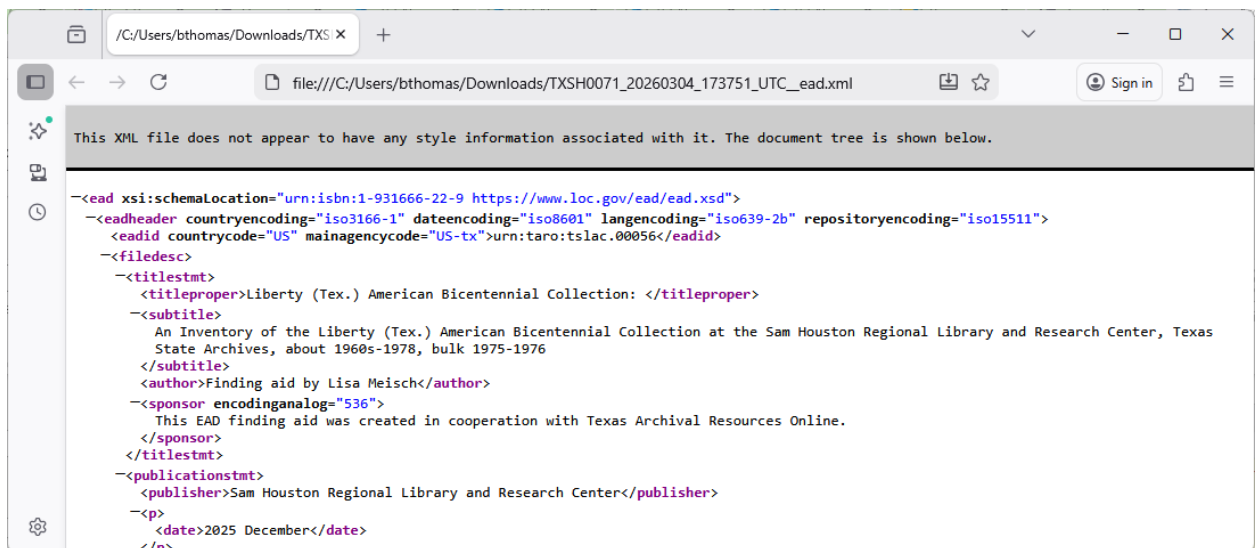

- Right click on the file, choose open with and select Firefox.

- If there is an xml error you will see a “XML Parsing Error:” with statement about what’s wrong and the line/column where it is wrong. Like so,

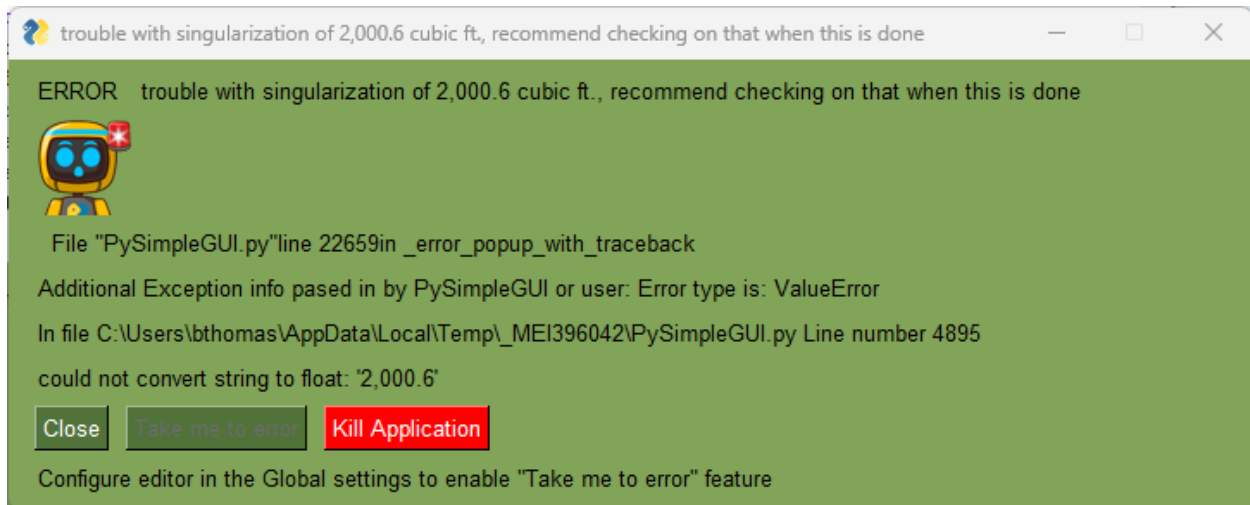

- Open the file in a text editor and look for that place in the file. Fix the error and refresh Firefox. Continue until the file comes out as valid. It should look something like the below. Rerun the tool and see if it still comes back with an error. If so, try the next step.

Second, puzzle out the problem

In the original screenshot above is an error message that is meant to indicate what is happening when an error occurs. Try to puzzle out what went wrong to rule out data entry issues rather than tool programming issues.

“trouble with singularization of 2,000.6 cubic ft., recommend checking on that when this is done.”

Additionally, just above the Kill Application button is a python-generated message saying programmatically what happened. In this case:

“could not convert string to float: ‘2,000.6’”

Based on these clues you know that the tool was trying to see if it should singularize the 2,000.6 cubic ft but could not convert the 2,000.6 to a float (a number that allows for decimals in programming). You know from life experience that commas in large numbers are used to help readers figure out how big something is at a glance. In this case 2, means two thousand. But you also know that , is a punctuation mark and not a number so you can infer that by removing the , from wherever it is in the 2,000.6, then it might solve the issue.

Keep in mind that there may be multiple instances of an error in an EAD file, so iterate until you either successfully run the file or you reach a place where you cannot fix it but errors still occur.

Report the issue

Reporting the issue is valid in the two cases listed below

Output not as expected

The tool is written by a human, one that doesn’t usually create finding aids, so said human has created a tool based on input from other people on what the output should look like. If the actual output it wrong, email the tool manager/creator (Brian) with the following:

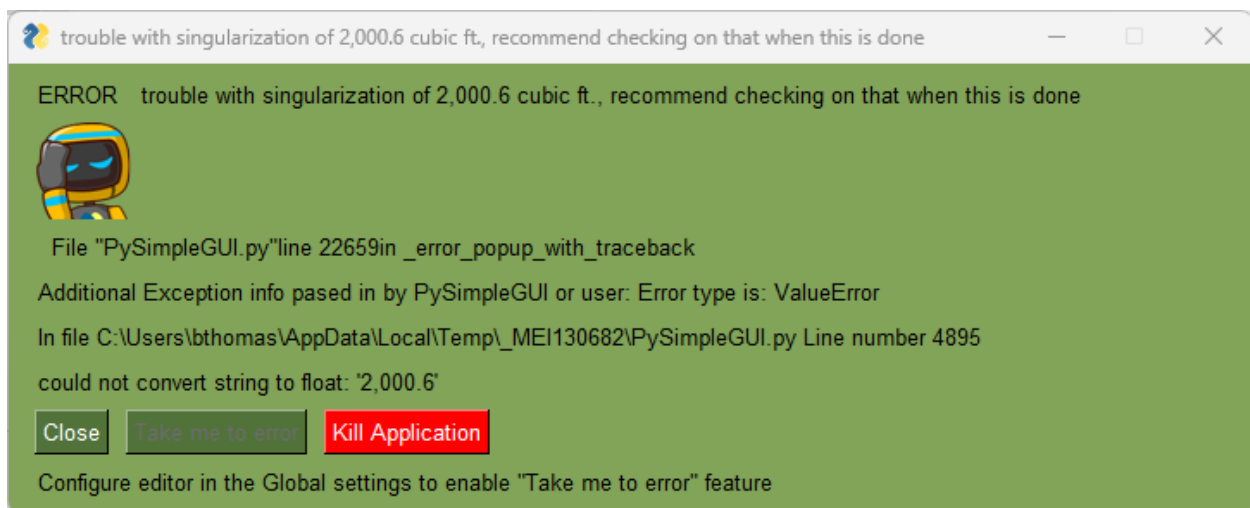

- Example finding aid TX# for reference and testing
- Description of the issue

- Screenshot of what the actual output looks like using Notepad++ or similar tool that will show line numbers
- Screenshot of what the desired output looks like using the same text editor tool.

Aesthetic issues that do not affect finding aid rendering will take a back seat to developing solutions to more pressing concerns. For example, the encoding analog attribute does not render on TARO. Added encodinganalog attributes in lower level scope and content tags has no affect on the end-user so it is a non-critical issue.

Tool error

In the prior example:

The error is fairly simple to parse. However, that is not always the case. A coding error or unanticipated variation of a specific type of thing may have occurred and couldn't be handled. If that happens, send the following to the tool manager/creator (Brian):

- Example/specific finding aid at issue using the TX# as reference
- Screenshot of the error message like shown above
- Any other helpful information you can provide.

The person doing the programming will try to puzzle out the problem and fix it. The screenshot is necessary because it includes the system error message which gives details on what line +/- the error is at. In this case "Line number 4895" refers to a line of code.

What the tool does, specifically

In order of how it completes the operation, without code snippets as examples (because it is over 5500 lines of code), the tool does the following:

- Restructures the input xml to allow for indents and other formatting. Meant to make reading and checking for error locations easier. Also checks for xml tagging errors.
- Add relatedencoding attribute to master ead tag
- Add scriptencoding attribute to eadheader
- Remove ArchivesSpace embedded id attributes from the xml tags
- Insert attribute type="inclusive" in unitdates if that is missing from the tag. This happens when a date is marked as singular
- Un-nest publication date from a <p> in publicationstmt. Also at era and calendar attributes
- Add publisher tag and attributes/text to publicationstmt
- Remove paragraph tags from publicationstmt
- Remove address tags from publicationstmt
- Simplify profile/creation/date to standard 10 character YYYY-MM-DD from one with timecodes
- Add type and audience attributes to archdesc
- Change archdesc/did/head text to "Overview"
- De-nest repository name out of a corpname tag in archdesc/did/repository
- Change label attribute to "Title:" for archdesc/did
- Add label=Creator: attribute to origination if not present
- Change archdesc/did/unitid label to TSLAC Control No.:
- Push additional origination parties into the controlaccess section ("There can be only one")
 - Corpname goes to "Corporate Names"
 - Famename goes to "Family Names"
 - Persname goes to "Personal Names"
 - Change all additional original parties encodinganalog attributes from 1xx to 7xx
- Change label of langmaterial to "Language:"
- Remove multiple langmaterials down to the first one
- At archdesc/did/unitdate add intervening commas so title renders properly
- Add label="Dates:" attribute to the archdesc/did/unitdate
- Add "Abstract:" label to abstract
- Add "Location:" label to physloc
- Add encodinganalog="351" attribute to archdesc/arrangement
- Add encodinganalog="583" attribute to archdesc/processinfo and archdesc/appraisal
- Add encodinganalog="340" attribute to archdesc/phystech

- Add header paragraph to top controlaccess <p><emph render="italic">The terms listed here were used to catalog the records. The terms can be used to find similar or related records.</emph></p>
- For nested controlaccess if corpname has attribute role="cre" move to a Corporate Names controlaccess group. Change encodinganalog from 6xx to 7xx
- For nested controlaccess if famname has attribute role="cre" move to Family Names controlaccess group. Change encodinganalog from 6xx to 7xx
- For nested controlaccess if persname has attribute role="cre" move to Personal Names controlaccess group. Change encodinganalog from 6xx to 7xx
- If the above results in a controlaccess with only the <head> child tag, remove the empty tag
- Normalize subject source attribute text
- Normalize corpname source attribute text
- Normalize famname source attribute text
- Normalize persname source attribute text
- Normalize geogname source attribute text
- Normalize function source attribute text
- Normalize title source attribute text
- Rearrange nested controlaccess (controlaccess/controlaccess) to the following order: Personal Names, Corporate Names, Subjects (Persons), Subjects (Organizations), Subjects, Places, Document Types, Titles, Functions
- Add series id counter to c01 tags when level="series"
- Singularize the text to physdesc/extent where it is appropriate
- At archdesc/did/physdesc add label="Quantity:" attribute and structure it so that part is within a (includes [value])
- Capitalize type="box" to type="Box" where that happens
- Use a complex set of rule to add trailing commas to unittitle, unitdate where applicable
- Use a complex set of rules to add trailing commas and parentheticals for physdesc/extent at series and other key upper levels
- Use a complex set of rules to add trailing commas, parentheticals, and brackets to physdesc/extent at lower levels
- For each physdesc/extent where the value includes "electronic file", if preceded by a physdesc/extent, encapsulate in a parenthetical (### electronic files)
- Use a complex set of rules to aggregate container information for a specific c## tag, determine if it is a range that should be concatenated to less intensive text (xxxx/###-01 thru 12, xxxx/###-16 for example)

- Remove head from c-level scope/content
- Remove head from c-level odd notes
- Remove parent attribute from containers where they exist
- Remove non-unique unitid tags
- Flag in dialog box if an emph tag has no render information
- Save file, reopen it and do brute text replacement where xml manipulation did not yield desired results
- Generate the html file using an xslt processor

About the tool creation/maintenance

The tool is written in pure python using PySimpleGUI as a method of creating a graphical interface. PySimpleGUI is a project which is no longer supported through active development but should be fine to use so long as you can find and attach it to your python instance. Other GUI generators were tried in 2026/2025 but were not successful or if successful not as maintainable.

Sample output

Sample EAD input and output is too verbose so it will not reasonably fit within this document, putting html output below. Run TXSH0071 through the tool to see ead input/output that corresponds to this example.

Overview

Creator:	Bicentennial Commission of Liberty (Tex.)
Title:	Liberty (Tex.) American Bicentennial collection
Title:	Liberty (Tex.) American Bicentennial collection
Dates:	about 1960s-1978
Dates (Bulk):	bulk 1975-1976
Abstract:	The City of Liberty, Texas, formed the Bicentennial Commission of Liberty in 1973 to plan and organize the community's celebration of the Bicentennial of the United States in 1976. The Liberty (Tex.) American Bicentennial collection documents the commission's planning of a community festival and construction of a bell tower for the city's Liberty Bell replica as well as the festival itself. The collection consists of correspondence, minutes, financial records, programs, fliers, press releases, clippings, photographs, publications, scrapbooks, and artifacts, dating about 1960s-1978, with the bulk dating 1975-1976.
Quantity:	2.6 cubic ft.
TSLAC Control No.:	TXSH0071
Location:	Please note that these records are housed at the Sam Houston Regional Library and Research Center , P.O. Box 310, Liberty, Texas 77575, 936-336-8821.
Language:	These materials are written predominately in English.
Repository:	Sam Houston Regional Library and Research Center

This EAD finding aid was created in cooperation with Texas Archival Resources Online.

Organizational History

The Bicentennial Commission of Liberty was formed by the City of Liberty, Texas, in 1973 to plan and organize the community's celebration of the Bicentennial of the United States in 1976. The Commission's major projects were to plan and carry out a community festival and to raise funds for the construction of a bell tower to house the city's Liberty Bell replica.

The Liberty Bell replica was cast in 1960 by the Whitechapel Bell Foundry of London, England, for the Liberty Muscular Dystrophy Research Foundation, which was established in 1950 by Liberty residents and sisters Sallie and Nadine Woods, themselves victims of muscular dystrophy. The bell served as a symbol for the foundation in its efforts to raise funds for medical research and assist other victims of the disease. The sisters gave the bell (which had been in storage in Houston, Texas, for several years) to the citizens of Liberty in 1974 with the condition that the city construct an appropriate tower to house it. Considering this project appropriate for the Bicentennial, the commission took it on as part of its work, with the goal of completing it in time for the 1976 celebration.

The community festival, which took place the weekend of April 24-25, 1976, included a parade through downtown Liberty, the dedication of the bell tower on the grounds of the Geraldine D. Humphreys Cultural Center, and historic home tours. Additional events the Bicentennial Commission of Liberty planned or took part in were the ringing of Liberty's Liberty Bell on July 4, 1976, joining the ringing of bells across the nation in honor of the Bicentennial, and the placement of a time capsule in the bell tower on April 6, 1978.

(Sources include: "1976 Bicentennial Commission Is Named," *Liberty Vindicator*, February 22, 1973; "Liberty Bell May Soon Ring Here," *Liberty Vindicator*, August 15, 1974; and the collection itself.)

Scope and Contents of the Collection

The City of Liberty, Texas, formed the Bicentennial Commission of Liberty in 1973 to plan and organize the community's celebration of the Bicentennial of the United States in 1976. The Liberty (Tex.) American Bicentennial collection

documents the commission's planning of a community festival and construction of a bell tower for the city's Liberty Bell replica, as well as the festival itself. The collection consists of correspondence, minutes, financial records, programs, fliers, press releases, clippings, photographs, publications, scrapbooks, and artifacts, dating about 1960s-1978, with the bulk dating 1975-1976.

The collection includes correspondence and other documents pertaining to fundraising for the bell tower and its construction, as well as minutes of Bicentennial Commission of Liberty meetings, photographs and event materials pertaining to the city's Bicentennial festival in April 1976, scrapbooks created by the commission containing event materials and clippings, and a flag with the American Revolution Bicentennial logo. Photographs depict festival parade entries such as floats and area school bands; prominent political figures such as former Texas Governors Price Daniel and Preston Smith and former Guam Governor Bill Daniel participating in the festival; the dedication of the bell tower; and tours of historic homes in the city.

Arrangement of the Collection

The collection is arranged by material type.

Restrictions and Requirements

Restrictions on Access

None.

Restrictions on Use

Under the Copyright Act of 1976 as amended in 1998, unpublished works are protected for the life of the author plus 70 years. The term of copyright for published material varies. Researchers are responsible for complying with U.S. Copyright Law (Title 17 U.S.C.).

Technical Requirements

Some materials may be too large to be photocopied. Please see Archives staff for assistance.

Researchers are required to wear gloves provided by the Archives staff when reviewing photographic materials.

Index Terms

The terms listed here were used to catalog the records. The terms can be used to find similar or related records.

[Worn by members of the Liberty Bicentennial Commission during the April 24, 1976 Bicentennial festival.]

Changelog

2026-03-09

- Updates to extent handling for lower levels to
 - encapsulate whole units in brackets,
 - have sub-descriptions like dimensions as comma separated,
 - have parts attached to preceding whole in (includes [X]) parenthetical,
 - have electronic files attached to preceding item in parentheticals without the includes
 - nested parentheticals applies
- updates to extent handling at higher levels under the <dsc> to
 - comma separate the wholes
 - attache parts to prior whole using a parenthetical (includes)
 - attach descriptors like dimensions in parenthetical
 - attach electronic files to preceding unit using parentheticals without the includes.
 - Nested parenthetical apply
- Update to containers
 - Sort containers before checking to step-wise value increases
 - When step-wise is only two items use “and” instead of thru
 - Create error pop-up when the containers can’t be processed for ranges based on atypical formatting

- Update nested control access to be in a specific order as given by the supervisor
